2014 ACC/AHA Guideline on Perioperative Cardiovascular Evaluation and Management of Patients Undergoing Noncardiac Surgery

Data Supplement

(Section numbers correspond to the full-text guideline.)

Data Supplement 1. Coronary Artery Disease (Section 2.1)	2
Data Supplement 2. Influence of Age and Sex (Section 2.1)	4
Data Supplement 3. HF and Cardiomyopathy (Sections 2.2 and 2.3)	7
Data Supplement 4. Valvular Heart Disease (Section 2.4)	12
Data Supplement 5. Arrhythmias and Conduction Disorders (Section 2.5)	13
Data Supplement 6. Pulmonary Vascular Disease (Section 2.6)	15
Data Supplement 7. Multivariate Risk Indices (Section 3.1)	17
Data Supplement 8. Exercise Capacity and Functional Capacity (Section 4.1).	18
Data Supplement 9. The 12-Lead ECG (Section 5.1).	20
Data Supplement 10. Assessment of LV Function (Section 5.2)	23
Data Supplement 11. Exercise Stress Testing for Myocardial Ischemia and Functional Capacity (Section 5.3)	25
Data Supplement 12. Cardiopulmonary Exercise Testing (Section 5.4)	30
Data Supplement 13. Pharmacological Stress Testing (Section 5.5)	36
Data Supplement 14. Radionuclide MPI (Section 5.5.2)	36
Data Supplement 15. Dobutamine Stress Echocardiography (Section 5.5.3)	37
Data Supplement 16. Preoperative Coronary Angiography (Section 5.7)	39
Data Supplement 17. Coronary Revascularization Prior to Noncardiac Surgery (Section 6.1)	40
Data Supplement 18. Timing of Elective Noncardiac Surgery in Patients With Previous PCI (Section 6.1.1)	40
Data Supplement 19. Perioperative Beta-Blocker Therapy (Section 6.2.1).	44
Data Supplement 20. Perioperative Statin Therapy (Section 6.2.2)	50
Data Supplement 21. Alpha-2 Agonists (Section 6.2.3)	51
Data Supplement 22. Perioperative Calcium Channel Blockers (Section 6.2.4)	52
Data Supplement 23. Angiotensin-Converting Enzyme Inhibitors (Section 6.2.5)	53
Data Supplement 24. Antiplatelet Agents (Section 6.2.6)	53
Data Supplement 25. Management of Postoperative Arrhythmias and Conduction Disorders (Section 6.3)	58
Data Supplement 26. Perioperative Management of Patients With CIEDs (Section 6.4)	62
Data Supplement 27. Choice of Anesthetic Technique and Agent (Section 7.1)	64
Data Supplement 28. Perioperative Pain Management (Section 7.2)	69
Data Supplement 29. Prophylactic Intraoperative Nitroglycerin (Section 7.3)	71
Data Supplement 30. Maintenance of Body Temperature (Section 7.5)	72
Data Supplement 31. Perioperative Use of Pulmonary Artery Catheters (Section 7.7)	75
Data Supplement 32. Surveillance and Management for Perioperative MI (Section 8.1)	76

Wijeysundera DN, et al., 2012 (1) <u>22893606</u>	To evaluate the outcomes of pts who underwent elective intermediate- to high-risk noncardiac surgery after stent implantation	Cohort study, secondary analysis of prospective clinical registry (2003–2009)	8,116 stent pts, who had stents within 10 y prior to noncardiac surgery	N/A	N/A	Surgeries included: AAA repair, carotid endarterectomy, peripheral bypass, total hip or knee replacement, large bowel resection, partial liver resection, Whipple, pneumonectomy, pulmonary lobectomy, gastrectomy, esophagectomy, total abdominal hysterectomy, radical prostatectomy, and cystectomy	N/A	N/A	Stent pts <2 y after stent compared to those pts >2 y after stent at time of noncardiac surgery	Overall mortality for pts who previously had stent was 1.2% (n=100) at 30 d and 5.2% (n=419) at 1 y	N/A	The overall risk of MACE at 30 d was 2.1% (n=170) and at 1 y was 9.8% (n=798). MACE was highest when major elective noncardiac surgery was performed within 45 d after coronary stent.	N/A	Event rates are low, limiting statistical power. Administrative databases may not adequately capture all in- hospital complications.
Mashour GA, et al., 2011 (2) <u>21478735</u>	Assess the incidence and predicators of periop stroke and its role in mortality in noncardiac, non- neurosurgical surgery	Secondary analysis of ACS NSQIP	523,059 pt data sets (deidentified from NSQIP database)	NSQIP participants from 250 participating U.S. medical centers for 4 y (2005– 2008)	N/A	General surgery, orthopedic, urology, otolaryngology, plastics, thoracic, minor vascular, and gynecology cases	Cardiac, major vascular, and neurosurgical cases	N/A	N/A	The incidence of periop stroke was 0.1%	N/A	1. Multivariate analyses indicated MI within 6 mo of surgery and was an independent risk factor for periop stroke. 2. Multivariate analyses indicated HTN (requiring medication) and was an	MI within 6 mo of surgery was an independent risk factor for periop stroke (OR: 13.2; CI: 8.9–19.7; p<0.001). HTN was an independent risk factor for periop stroke (OR: 3.8; CI:	Observational study does not allow for additional data collection for pts exhibiting primary outcome. In addition, the data definitions are clinically relevant, but could not be modified for purposes of

Data Supplement 1. Coronary Artery Disease (Section 2.1)

												independent risk factor for periop stroke.	3.1–4.7; p<0.001).	this study.
Healy KO, et al., 2010 (3) <u>20412467</u>	To evaluate the impact of LVEF on periop outcomes and long-term mortality in pts with HF undergoing intermediate- to high-risk surgery	Retrospective chart review	174 pts	Pts diagnosed with HF who underwent intermediate- or high-risk noncardiac surgery from 2001–2004	N/A	Diagnosis with HF; intermediate- or high-risk noncardiac surgery (including PVD surgery, aortic repair, carotid endarterectomy, head & neck, intraperitoneal, noncardiac intrathoracic, orthopedic or prostate surgery)	N/A	N/A	Pts with HF compared by LVEF (>50% normal; 40%–50% mildly reduced; 30%≥40% moderately reduced; <30% severely reduced)	1. 30.5% (n=53) had \geq 1 periop events: death (n=14, 8.1%); MI (n=26, 14.9%); HF exacerbation (n=44, 25.3%) 2. Severely reduced LVEF (<30%) independently associated with adverse events.	N/A	N/A	1. Multivariate analyses for LVEF was an independent predictor of periop events including mortality (OR: 4.88; CI: 1.78– 14.40).	Small, retrospective chart review from single institution.
Ferket BS, et al., 2011 (4) <u>21474039</u>	To critically appraise guidelines on imaging of asymptomatic CAD	Systematic review	14 guidelines included in the review (published between 2003–2010)	N/A	N/A	 Used IOM definition of clinical practice guidelines. Contained recommendations on imaging of asymptomatic CAD aimed to prevent first coronary event. Involved healthy persons (adults). Produced on behalf of national or international medical specialty society. 	N/A	N/A	N/A	1. 8 of 14 studies recommended against or concluded that there was insufficient evidence to recommend testing of asymptomatic CAD. 2. In 6 of the guidelines testing was indicated for pts with a priori elevated risk level based on absolute CAD risk or multiple risk factors (e.g., Framingham risk score).	N/A	1. 1 guideline recommended CT calcium scoring solely in an intermediate CAD risk population. 2. Guidelines unanimously did not advocate CT calcium scoring for low or high CAD risk pts.	N/A	Only guidelines developed by national or international medical specialty organizations were reviewed
Wijeysundera	To determine	Cohort study	Adult pts	Pts who had	Pts who did	Adults >40 y of	N/A	N/A	N/A	1. Hospital	1. Preop	Effects of	Mortality:	1. Did not

Impact of HF	on Periop and Postop	Outcomes											
Hammill BG, et al., 2008 (9) <u>18362586</u>	To determine operative mortality and 30-d all-cause readmission among pts with HF, CAD, or neither who underwent major noncardiac surgery	Retrospective	159,327 procedures	N/A	N/A	Pts >65 y of age with Medicare FFS coverage, and underwent major noncardiac procedures from 2000–2004	Pts with end-stage renal disease and pts who did not have at least 1 y of Medicare FFS eligibility before surgery	N/A	Pts with HF or CAD against neither	Operative mortality and 30-d all-cause readmission	N/A	Pts with HF were at significantly higher risk for both outcomes compared with pts with CAD	Adjusted HR of mortality and readmission for pts with HF, compared with pts with neither HF nor CAD, were 1.63 (95% CI: 1.52– 1.74) and 1.51 (95% CI: 1.45–1.58), respectively
Hernandez AF, et al., 2004 (10) <u>15464326</u>	To evaluate mortality and readmission rates of pts with HF after major noncardiac surgery	Retrospective	1,532 pts with HF and 1,757 pts with CAD who underwent major noncardiac surgery. 44,512 pts in control group with major noncardiac surgery.	N/A	N/A	>65 y of age; 1997– 1998 5% sample of Medicare beneficiaries, pts with HF who underwent major noncardiac surgery	?	N/A	Pts with HF or CAD against neither	Operative mortality (death before discharge or within 30 d of surgery)	?	Risk-adjusted 30-d readmission rate 0	The risk-adjusted operative mortality (death before discharge or within 30 d of surgery) for HF 11.7%, CAD 6.6%, and control 6.2% (HF vs. CAD, p<0.001; CAD vs. control; p=0.518). The risk- adjusted 30-d readmission rate for was HF 20.0%, CAD 14.2%, and control 11.0% (p<0.001).
van Diepen S, et al., 2011 (11) <u>21709059</u>	To compare the postop mortality of pts with HF, AF, or CAD undergoing major and minor noncardiac	Retrospective	Nonischemic HF (n=7,700), ischemic HF (n=12,249), CAD (n=13,786), or AF (n=4,312)	N/A	N/A	Pts who underwent noncardiac surgery between April 1, 1999–September 31, 2006, in Alberta, Canada	?	N/A	?	The main outcome was 30-d postop mortality.	?	Among pts undergoing minor surgical procedures, the 30-d postop mortality was 8.5% in NIHF, 8.1% in IHF, 2.3% in CAD,	Unadjusted 30-d postop mortality was 9.3% in NIHF, 9.2% in IHF, 2.9% in CAD, and 6.4% in AF (each vs. CAD, p<0.0001). After multivariable

	surgery										-	and 5.7% in AF (p<0.0001)	adjustment, postop mortality remained higher in pts with NIHF, IHF, and AF than in those with CAD (NIHF vs. CAD, OR: 2.92; 95% CI: 2.44–3.48; IHF vs. CAD, OR: 1.98; 95% CI: 1.70–2.31; AF vs. CAD, OR: 1.69; 95% CI: 1.34–2.14).
Xu-Cai YO, et al., 2008 (12) <u>18315993</u>	To evaluate modern surgical outcomes in pts with stable HF undergoing elective major noncardiac surgery and to compare the experience of pts with HF who have reduced vs. preserved LVEF	Retrospective	557 pts with HF (192 LVEF ≤40% and 365 LVEF>40%) and 10,583 controls	N/A	N/A	Pts who underwent systematic evaluation by hospitalists in a preop clinic before having major elective noncardiac surgery between January 1, 2003– March 31, 2006		N/A	Mortality in HF with reduced EF or preserved EF vs. control pts	1-mo postop mortality and1-y mortality	?	Unadjusted differences in mean hospital LOS among pts with HF vs. controls (5.7 vs. 4.3 d; p<0.001) and 1- mo readmission (17.8% vs. 8.5%; p<0.001) were also markedly attenuated in propensity- matched groups	Unadjusted 1-mo postop mortality in pts with both types of HF vs. controls was 1.3% vs. 0.4% (p=0.009), but NS in propensity- matched groups (p=0.09). Crude 1-y HR (p<0.01) for mortality were 1.71 (95% CI: 1.5–2.0) for both types of HF, 2.1 (95% CI: 1.7–2.6) in pts with HF who had LVEF ≤40%, and 1.4 (95% CI: 1.2–1.8) in those who had LVEF >40%; however, the differences were NS in propensity-matched groups (p=0.43).
Impact of LVE	To determine	top Outcomes	11 072 pts	N/A	N/A	31 studies including	>	NI/A	Deaths per	Mortality in	2	The risk of death did	Dts with HE DEE had
analysis Global Group in Chronic Heart Failure (MAGGIC), 2012 (13)	whether survival in pts with HF- PEF is similar to those pts with HF- REF	individual pt data	(10,347 with HF-PEF and 31,625 with HF-REF)			pts with HF	1	IV/A	1,000-pt y	HF-PEF vs. HF-REF		not increase notably until EF fell below 40%.	lower mortality than those with HF-REF (adjusted for age, sex, etiology, and Hx of HTN, diabetes mellitus, and AF; HR: 0.68; 95% CI: 0.64– 0.71)

21821849													
Kazmers A., et al., 1988 (14) <u>3047443</u>	To determine periop (30-d) and subsequent outcome after major vascular surgery in those with severe cardiac dysfunction, defined by LVEF ≤35%	Retrospective	35 pts who required 47 major vascular procedures	N/A	N/A	From August 1, 1984–January 1, 1988, pts with LVEF ≤35% who required vascular surgery	?	N/A	Mortality according to LVEF	Cumulative mortality	?	?	Survival for those with an LVEF ≤29% was significantly worse than for those with an LVEF >29% (p<0.012). The cumulative mortality rate was 59% LVEF ≤29% and 18% in those with LVEF >29% (p<0.029)
Kazmers A., et al., 1988 (15) <u>3348731</u>	To determine periop and long- term mortality according to LVEF in pts undergoing carotid endarterectomy	Retrospective	73 pts before 82 carotid operations	N/A	N/A	Pts who had radionuclide ventrioculography before carotid endarterectomy	?	N/A	Periop and long-term mortality in pts with LVEF <35% vs. LVEF >35%	Periop and cumulative1-y mortality	Periop cardiac complications were more frequent with LVEF ≤35% , occurring in 43% vs.9% in pts with LVEF >35%	?	There was no statistical difference in periop mortality, but cumulative mortality differed, being 57% (4/7) in those with EF of \leq 35% vs. 11% (7/66) in pts with LVEF >35%
McCann RL, Wolfe WG, 1989 <u>2778886</u>	To evaluate the influence of LVEF on both periop and long-term morbidity and mortality	Retrospective	104	N/A	N/A	Preop LVEF measured in 104 of 208 pts undergoing elective AAA	?	N/A	19 pts with LVEF <35% was compared to 85 pts with LVEF >35%	Periop and cumulative mortality	?	?	The periop mortality was not significantly different (low EF, 5%; high EF, 2%). The cumulative life-table survival of the 2 groups was not statistically different. 4-y actuarial survival 0.74 in low EF compared to 0.63 (p=NS) in the high EF group
Healy KO, et al., 2010 (3) <u>20412467</u>	To determine impact of LVEF on outcome in pts with HF undergoing noncardiac surgery	Retrospective	174	?	?	174 subjects who underwent intermediate- or high-risk noncardiac surgery	?	?	?	30-d and long-term mortality	Adverse periop events occurred in 53 (30.5%) of subjects, including 14 (8.1%) deaths within 30 d, 26 (14.9%) MI, and 44 (25.3%) HF exacerbations	Among the factors associated with adverse periop outcomes in the first 30-d were advanced age (e.g., >80 y), diabetes mellitus, and a severely decreased EF (e.g., <30%)	Long-term mortality was high and Cox proportional hazards analysis demonstrated that EF was an independent risk factor for long term mortality

Role of HF in	CV Risk Indices												
Goldman L, et al., 1977 (15, 16) <u>904659</u>	To determine which preop factors affect the development of cardiac complications after major noncardiac operations	Prospective cohort	1,001 pts	N/A	N/A	?	?	?	?	Postop fatality and life- threatening complication	?	36 of the 39 pts manifesting ≥1 life- threatening cardiac complications had pulmonary edema. 9 independent significant correlates of life-threatening and fatal cardiac complications: preop S3 or JVD; MI in the preceding 6 mo; >5 PVC/min; rhythm other than sinus or presence of PACs on preop ECG; >70 y of age; intraperitoneal, intrathoracic or aortic operation; emergency operation; important valvular AS; and poor general medical condition.	Clinical signs of HF including an S3 gallop or JVD were the most significant predictors of postop life- threatening or fatal cardiac complications. In the final analysis, signs of HF carried the highest weight in the original CRI. 10 of the 19 postop cardiac fatalities occurred in the 18 pts at highest risk.
Detsky AS, et al., 1986 (15, 17) <u>3772593</u>	To validate a previously derived multifactorial index in their clinical setting and to test a modified version of the index	Prospective cohort	455	?	?	455 consecutive pts referred to the general medical consultation service for cardiac risk assessment prior to noncardiac surgery	?	?	?	Major cardiac complications	?		The interobserver agreement for S3 and JVD was poor (k statistic, 0.42 and 0.50, respectively). Therefore, to make the diagnosis of HF more objective and reproducible preoperatively, grouped HF into 2 categories as the presence of alveolar pulmonary edema within 1 wk or ever. Definition was stricter; HF still had a major role in predicting events and being a

												major outcome. Of the 43 serious events, there were 10 new or worsened episodes of HF without alveolar pulmonary edema, and 5 episodes of alveolar pulmonary edema.
Lee TH, et al., 1999 (15, 18) <u>10477528</u>	To develop and validate an index for risk of cardiac complications	Prospective cohort	4,315	N/A	N/A	4,315 pts ≥50 y of age undergoing elective major noncardiac procedures in a tertiary-care teaching hospital	?	?	The main outcome measures were major cardiac complications	?	?	HF was both an important predictor and a key complication. Outcome required a formal reading of pulmonary edema on the chest x-ray. In the validation set, it provided the highest OR (4.3) for major cardiac complications. 6 independent predictors of complications were identified in RCRI: high-risk type of surgery, Hx of ischemic heart disease, Hx of CHF, Hx of cerebrovascular disease, preop treatment with insulin, and preop serum creatinine >2.0 mg/dL.

AAA indicates abdominal aortic aneurysm; AF, atrial fibrillation; AS, aortic stenosis; CAD, coronary artery disease; CHF, congestive heart failure; CI, confidence interval; CRI, Cardiac Risk Index; CV, cardiovascular; ECG, electrocardiogram; EF, ejection fraction; FFS, fee-for-service; HF, heart failure; HF-PEF, heart failure with preserved ejection fraction; HF-REF, heart failure with reduced ejection fraction; HR, hazard ratio; HTN, hypertension; Hx, history; IHF, ischemic heart failure; JVD, jugular venous distention; LOS, length of stay; LVEF, left ventricular ejection fraction; MI, myocardial infarction; n, subgroup of N; N/A, not applicable; NIHF, nonischemic heart failure; NS, nonsignificant; OR, odds ratio; PAC, pulmonary artery catheterization; periop, perioperative; postop, postoperative; pts, patients; PVC, premature ventricular contraction; preop, preoperative; RCRI, Revised Cardiac Risk Index; RR, relative risk; and S3, third heart sound.

Data Supplement 4. Valvular Heart Disease (Section 2.4)

McFalls EO, et al., 2004 (36) <u>15625331</u>	Compare rates of morbidity and mortality with/without coronary artery revascularization before cardiovascular operations	RCT, multicenter	510	258	252	Elective vascular procedure, increased risk of cardiac complications, ≥1 major coronary arteries with >70% stenosis	Urgent or emergent vascular procedure, severe coexisting illness, prior revascularization without evidence of recurrent ischemia	CABG or coronary angioplasty	No coronary revascularization	Long-term mortality	N/A	Periop MI: 7.1% in intervention group vs. 5.0% in control group	NS	Only looked at rate of periop MI in vascular surgery pts
Davenport	Compare	Retrospective	427	99	328	ACS NSQIP	Pts who died	EVAR	Open AAA repair	Mortality: 22.2%	None	Cardiac	p=0.003	Retrospective

DL, et al., 2010 (37) <u>19939609</u>	outcomes of open vs. endovascular repair of ruptured AAA	cohort study using prospectively collected national database NSQIP				database from 2005–2007 at 173 hospitals. Pts were selected who had ruptured AAA	before having operation			EVAR vs. 37.2% open		arrest or infarction: 4.0% in EVAR vs. 8.2% in open	for mortality; p=0.159 for cardiac arrest or infarction	and not randomized.
Jordan SW, et al., 2013 (38) <u>23249982</u>	Comparing outcomes of plastic surgery operations with and without resident involvement	Retrospective cohort study using prospectively collected national database NSQIP	10,356	4,453	5,903	ACS NSQIP database from 2006–2010 with "plastics" listed as primary service to include pts with reconstructive procedures	Cosmetic procedures	Resident involvement	No resident involvement	Overall complication, wound infection, graft/prosthesis/flap failure, mortality rates	N/A	Cardiac arrest: 0.13% with resident; 0.14% no resident: MI: 0.11% with resident; 0.08% no resident	NS	Retrospective and not randomized.

AAA indicates abdominal aortic aneurysm; ACS NSQIP, American College of Surgeons National Surgical Quality Improvement Program; CI, confidence interval; EVAR, endovascular aneurysm repair; CABG, coronary artery bypass graft; HR, hazard ratio; MI, myocardial infarction; N/A, not applicable; NS, nonsignificant; OR, odds ratio; periop, perioperative; pts, patients; RCT, randomized controlled trial, and RR, relative risk.

Data Supplement 8. Exercise Capacity and Functional Capacity (Section 4.1)

Study Name, Author, Year	Aim of Study	Study Type	Study Size (N)	Patient F	Population	Study Intervention	Endpoints	P Values, OR: HR: RR & 95% Cl:	Study Limitations & Adverse Events
				Inclusion Criteria	Exclusion Criteria		Primary Endpoint (Efficacy) and Results		
Leung JM, et al., 2001 (39) <u>11555070</u>	To determine prevalence and predictors of adverse postop outcomes in older surgical pts undergoing noncardiac surgery	Prospective cohort	544	Pts ≥70 y of age undergoing noncardiac surgery at an academic medical center	Local anesthesia or MAC	N/A	3.7% of pts died and 21% experienced postop complications. Decreased functional status preop was an important predictor of adverse neurological outcomes (OR: 3)	OR: 3 (95% CI: 1.4–6.4) for adverse neurological outcome	N/A
Reilly DF, et al., 1999 (40) <u>10527296</u>	To determine the relationship between self-reported exercise tolerance and serious periop complications	Cohort	600	Consecutive outpts referred to a medical consultation clinic at a tertiary care medical center	N/A	Pts were asked to estimate the number of blocks they could walk and stairs they could climb without symptoms	All pts were monitored for 26 serious periop complications. Pts with poor exercise tolerance (<4 blocks or <2 flights) had more complications (20.4% vs. 10.4%).	Likelihood of serious complications was inversely related to the number of blocks that could be walked (p=0.006) or flights of stairs climbed (p=0.01).	N/A
Older P, et al., 1999 (41) <u>10453862</u>	To develop an integrated strategy for the identification and subsequent management	Cohort	548	>60 y of age (or younger with known cardiopulmonary disease) scheduled for	N/A	All pts underwent cardiopulmonary exercise testing. Anaerobic threshold results and hemic ECG	Mortality was 3.9%. There were no deaths in those assigned to a ward strategy based on their cardiopulmonary parameters.	N/A	N/A

	of high-risk pts in order to reduce both morbidity and mortality			major intra-abdominal surgery		changes with exercise were used to triage to ICU, HCU, and ward.			
Wiklund RA, et al., 2001 (42) <u>11393264</u>	To evaluate METs as a predictor of cardiac complications following elective noncardiac surgery	Retrospective cohort	5,939	Pts undergoing preanesthetic assessment within 2 mo of elective noncardiac surgery	N/A	N/A	94 pts (1.6%) had cardiac complications, 38% occurred after vascular surgery. Age and ASA Physical Status Class were independent predictors of complications but METs were not once ASA Physical Status Class was included.	N/A	ASA Physical Status Class and METs were colinear
Crawford RS, et al., 2010 (43) <u>20141958</u>	To relate preop functional status to periop morbidity and mortality	Cohort	5,639	Vascular surgery pts undergoing infrainguinal surgical bypass	N/A	N/A	Dependent pts (18.4%) were older and had more diabetes mellitus, COPD ESRD on dialysis, and critical limb ischemia. Dependent pts had higher mortality (6.1% vs. 1.5%) and complication rates (30.3% vs. 14.2%). Dependent status was an independent predictor of death and major complications.	Serious complications OR: 2 (95% CI: 1.7–2.4) and death OR: 2.3 (95% CI: 1.6–3.4)	N/A
Goswami S, et al., 2012 (44) <u>23042223</u>	To determine incidence and risk factors for intraoperative cardiac arrest	Cohort	362, 767	Noncardiac surgeries in the ACS NSQIP database	N/A	N/A	Incidence of intraoperative CA was 7.22 per 10,000. Predictors included being functionally dependent (OR: 2.3) as well as emergency surgery and the amount of transfusions needed.	Adjusted OR:2.33 (95% CI: 1.69–3.22) for being functionally dependent	Definition of dependent in NSQIP database based on need for assistance with ADLs rather than METs values.
Tsiouris A, et al., 2012 (45) <u>22484381</u>	To assess the effect of functional status on morbidity or mortality	Cohort	6,373	Thoracic surgery pts in 2005-2009 NSQIP database	N/A	N/A	812 pts had dependent functional status preoperatively. Mortality was 7.7 times higher in them than in those with nondependent functional status. Complications were also increased.	OR: 7.7 for mortality in dependent pts preop as compared with nondependent pts (p<0.001). OR: 9.3 for prolonged ventilation and OR: 3.1 for reintubation.	N/A

ACS indicates American College of Surgeons; ADLs, activities of daily living; ASA, American Society of Anesthesiologists; CA, cardiac arrest; CI, confidence interval; COPD, chronic obstructive pulmonary disease; ECG, electrocardiogram; ESRD, end-stage renal disease; HCU, high care unit; HR, hazard ratio; ICU, intensive care unit; MAC, monitored anesthesia care; METs, metabolic equivalent; N/A, nonapplicable; NSQIP; National Surgical Quality Improvement Program; OR, odds ratio; periop, perioperative; postop, postoperative, preop, preoperative; pts, patients; and RR, relative risk.

													predictor of risk.	
Leppo J, et al., 1987 (64) <u>3805515</u>	It was hypothesized that the presence of thallium redistribution would be of prime importance in detecting those pts having coronary disease who have potentially jeopardized myocardium	Prospective	100 underwent dipyridamole thallium scintigraphy; 69 underwent exercise testing (56, Bruce protocol), 13 arm ergometry). 27 didn't undergo exercise because of physical limitations and 4 because of scheduling conflicts.	N/A	N/A	Consecutive pts admitted for elective aortic or limb vascular surgery.	New or medically UA, recent (4-6 mo) MI.	N/A	N/A	Of the 89 pts who underwent vascular surgery without cardiac catheterization, 15 had a periop MI (1 fatal and 10 non-Q wave infarctions). Only the presence of either an abnormal scan (p=0.001) or thallium redistribution (p=0.001) demonstrated a significant difference.	None	Although pts with ST depression and shorter total exercise time tended to have more events, these differences were not statistically significant. No events occurred in the 12 pts who were able to perform >9 min of exercise.	predictor of risk. From the regression analysis, the predicted probability of a cardiac event in pts not having redistribution was 2±2% (1 of 47), but in pts with redistribution it was 33±7% (14 of 42) .In the second regression analysis which included the 60 pts having both exercise and scan studies, only the presence of thallium redistribution was significant at stop 0	Relatively small number of patients undergoing exercise (69, and 13 of these were arm ergometry). High event rates not seen today.
McPhail N, et al., 1988 (65) <u>3336127</u>	To report on their experience with the use of exercise testing in an effort to predict cardiac complications in pts requiring arterial repair	Observational	110, 9 excluded. Treadmill exercise in 61 pts (Bruce protocol) and arm ergometry in 40 pts.	N/A	N/A	Consecutive pts requiring arterial surgery who had clinical evidence of significant CAD were referred for cardiac evaluation	9 pts with recent MI (<6 mo), UA, or CHF were excluded	N/A	N/A	Contingency table analysis showed that maximum heart rate achieved during exercise was a significant predictor of complications (MI, CHF, malignant ventricular arrhythmias and cardiac death). Of 70 pts who achieved <85% of their predicted maximum heart	None	Of 21 pts with a positive stress test (≥1 mm ST depression) who attained <85% of their predicted maximum heart rate, 7 (33.3%) developed cardiac complications. In contrast, no complications occurred among 9 pts	The logistic regression analysis indicates that pts who achieved a high maximal heart rate during exercise had a low probability of developing cardiac complications (p=0.040). A similar result was observed when high METs	Unclear selection of pts ("clinical evidence of significant CAD"). Relatively small number underwent treadmill exercise. High event rates not seen today.

										rate, 17 (24.3%) developed complications. Only 2 (6.6%) of 30 pts who achieved >85% maximum predicted heart rate had complications (p=0.0396). The degree of ST segment depression that occurred with exercise was NS in predicting cardiac complications.		with ST depression of ≥1 mm who were able to achieve 85% of their predicted maximum heart rate.	was present (p=0.033). Note: 4 METs ~25% event rate.	
Sgura FA, et al., 2000 (66) <u>11014727</u>	To determine the value of preop exercise testing with a supine bicycle in predicting periop cardiovascular events and long- term outcomes in pts scheduled for vascular surgery	Consecutive series	149	N/A	N/A	Underwent supine exercise testing and vascular surgery	Underwent vascular surgery or coronary revascularization before exercise testing	N/A	N/A	Cardiovascular events within 30 d of surgery: death, MI, cardiac arrest; 7% had periop cardiovascular events	None	No significant association between exercise- induced ST depression, radionuclide angiographic factors, or any clinical variable (other than age) and periop cardiovascular events or long- term mortality	The level of peak exercise achieved was associated with periop CV events with 12% occurring in low- capacity pts (<4 METs), 3% occurring in intermediate- capacity pts (4– 7 METs), and none in the high capacity pts (>7 METs) (p=0.03). Long-term survival rates were substantially less in the low- workload group than in intermediate- and high- workload groups (p=0.007).	Pts were selected who were felt to be capable of exercising. Selected group of pts for whom exercise radionuclide angiography was ordered.

AAA indicates abdominal aortic aneurysm; CABG, coronary artery bypass graft; CAD, coronary artery disease; CHF, congestive heart failure; CV, cardiovascular; ECG, echocardiogram; HR, hazard ratio; Hx, history; LV, left ventricular; MET; MI, myocardial infarction, N/A, not applicable; NS, nonsignificant; periop, perioperative; preop, preoperative; pts, patients; PVD, peripheral vascular disease; UA, unstable angina; VF, ventricular fibrillation; and VT, ventricular tachycardia.

Hartley RA, et al., 2012 (67) <u>23001820</u>	To evaluate whether preop CPET is useful in the prediction of 30- and 90-d mortality in pts undergoing elective open AAA repair and EVAR	Prospective cohort	415	N/A	N/A	Pts undergoing AAA repair and CPET	None given	N/A	N/A	On multivariable analysis, open repair, AT <10.2 mL/kg/min, anemia and inducible cardiac ischemia were associated with 30-d mortality. Anemia, inducible cardiac ischemia and peak VO2 <15 mL/kg/min were associated with 90-d mortality on multivariable analysis. Pts with ≥2 subthreshold CPET values were at increased risk of both 30- and 90-d mortality.	None	None	On multivariable analysis, open repair (OR: 4.92; 95 % CI: 1.55–17.00; p=0.008), AT below 10.2 mL/kg/min (OR: 6.35; 95 % CI: 1.84–29.80; p=0.007), anemia (OR: 3.27; 95 % CI: 1.04–10.50; p=0.041) and inducible cardiac ischemia (OR: 6.16; 95 % CI: 1.48–23.07; p=0.008) were associated with 30-d mortality. Anemia, inducible cardiac ischemia and peak VO2 <15 mL/kg/min (OR: 8.59; 95 % CI: 2.33–55.75;	Observational study, relatively small number of deaths (6 in EVAR group and 8 with open AAA repair at 30 d and 11 EVAR/8 open repair at 90 d), mix of EVAR and open repair

													p=0.005) were associated with 90-d mortality on multivariable analysis. Pts with ≥2 subthreshold CPET values were at increased risk of both 30- and 90- d mortality.	
Thompson AR, et al., 2011 (68) <u>21929919</u>	To assess the usefulness of CPET and the Detsky score to predict midterm mortality in AAA pts assessed for open repair. Secondary aim to compare ability of CPET and other scores to predict 30-d periop mortality.	Prospective cohort	102	66 (deemed "fit" by CPET variables, comorbidities, and size of AAA)	36 (deemed "unfit" by CPET variables, comorbidities, and size of AAA)	Consecutive pts undergoing AAA repair	None given	N/A	N/A	Midterm (30- mo) survival was predicted by the anaerobic threshold (p=0.02).	None	None of the scoring tools were able to predict 30- d major morbidity or mortality as defined by periop complications (p>0.05)	Midterm (30-mo) survival was predicted by the anaerobic threshold (p=0.02)	Lack of detail on cause of death, relatively small numbers total, and deaths (1 30- day death), not clear what "cardiac events" were
Prentis JM, et al., 2012 (69) <u>22858436</u>	To assess the use of CPET to predict morbidity in unselected pts scheduled for elective EVAR or open AAA repair	Observational	185 pts (101 EVAR and 84 open repair)	N/A	N/A	"Unselected" pts undergoing EVAR or open AAA repair at a single center	AT not confidently determined from CPET data	N/A	N/A	Open repair: AT was a significant independent predictor of postop complications and hospital LOS. EVAR: No independent variables were significantly predictive of major postop complications on univariate analysis. No multivariate	None	Open repair: The in-hospital mortality rate was 5 of 84 (5.9%). 3 of 27 pts (11.1%) were in the unfit group (AT<10) compared with 2 of 58 (3.4%) in the fit group (AT>10), both of whom had an AT <12 mL/min/kg. Open repair: Cardiac complications (MI, LV failure, major arrhythmias) 18.5% unfit vs. 3.5% fit, p=0.03.	Open repair: ROC curve analysis showed that 10.0 mL/min/kg was the optimal AT level to predict those at risk for increased rates of postop complications. This was sensitive (70%) and specific (86%), with good accuracy (area under the curve, 0.75; 95% Cl: 0.63–	Single center. Not consecutive pts although "unselected." No mortality data.

										analysis was performed.			0.83; p=0.001).	
Carlisle J, et al., 2007 (70) <u>17440956</u>	To review whether preop fitness, measured by CPET, correlated with survival following elective open AAA repair	Observational	130 (37 pts did not undergo CPET and weren't analyzed)	N/A	N/A	Pts undergoing AAA repair	Did not undergo CPET	N/A	N/A	Multivariable analyses indicated that survival, to both 30 d and for the total observation period, correlated best with VE/VCO2. The risk of death was greater with higher values of VE/VCO2. The RCRI was significantly associated with midterm survival, as was the AT, but to a lesser degree.	None	Unfit pts had an RCRI >1 and a VE/VCO2 of >42. Fit pts had an RCRI of 1 (and any VE/VCO2), or an RCRI >1 but a VE/VCO2 lower than 43. There were 30 unfit pts and 100 fit pts.	Multivariable analysis of midterm (median 35 mo) survival: VE/ VCO2 HR: 1.13 (Cl: 1.07–1.19; p<0.001); RCRI HR: 1.76 (Cl: 1.07–1.19; p=0.006); AT HR: 0.84 (Cl: 0.72–0.98; p=0.033). The 2- y survival rate was 55% for unfit pts and 97% for fit pts; the absolute difference was 42% (95% Cl: 18%–65%; p<0.001).	Single center, observational, unclear selection of CPET variable cutoffs
Older P, et al., 1993 (71) <u>8365279</u>	To compare the extent of cardiac failure classified by AT and postop mortality	Prospective cohort Prospective	187	N/A	N/A	Pts >60 y of age scheduled for major abdominal surgery ("likely to cause a significant increase in oxygen demand, e.g., AAA resection, anterior resection of the rectum")	Could not complete CPET (4 of 191 pts)	N/A	N/A	10 CV deaths in 55 pts (18%) with AT <11 mL/kg/min vs. 1 CV death in 132 pts (0.8%) with AT of \geq 11 mL/kg/min (p<0.001)	None	42% mortality in the 19 pts with an AT of <11 mL/min/kg and preop ischemia (h/o MI, angina or ischemia on CPET) vs. 4% mortality in the 25 pts with AT >11 and ischemia (p<0.01).	10 CV deaths in 55 pts (18%) with AT <11 mL/kg/min vs. 1 CV death in 132 pts (0.8%) with AT of ≥11 mL/kg/min (p<0.001)	Single center, not blinded to results (all pts with ischemic tests admitted to ICU regardless of AT)
CP, et al., 2010 (72) <u>20134313</u>	hypothesis that CPET does not improve preop assessment of pt risk of postop	single center cohort study	went on for operation and 48 did not; 7			undergo major elective surgery (AAA repairs, aortobifem grafts, liver	and elective colorectal, urological, or orthopedic operations			postop d 7		complication rate was 25% in pts with AT <10.1 mL/kg/min and 3% in those with AT	operator curve analysis showed an optimal AT threshold level of 10.1	selected nature of the chosen pt cohort. 48 pts did not undergo planned

McFalls EO, et al., 2004 (36) <u>15625331</u>	Revascularization vs. medical therapy before elective major vascular surgery	RCT	510	258	252	Vascular surgery	Urgent/emergency: UA; LM; EF<20%; AS	Revascularization (CABG or PCI)	Medical therapy	Death (30 d) 3.1% (revascularization) vs. 3.4% (medical therapy)	Lost to follow up: death 2.7 y	Primary endpoint p=0.87; secondary endpoint p=0.92 (RR: 0.98; 95% CI: 0.7–1.37)

AS indicates aortic stenosis; CABG, coronary artery bypass graft; CI, confidence interval; EF, ejection fraction; PCI, percutaneous coronary intervention; RCT, randomized controlled trial; RR, relative risk; and UA, unstable angina.

Data Supplement 18. Timing of Elective Noncardiac Surgery in Patients With Previous PCI (Section 6.1.1)

Table 1. Risk of NCS Following PCI With BMS and Risk of NCS Following PCI With DES

Author,	Study Type	Study		Тур	e of Sur	gery		PCI to	MAC	E	APT	in Perioper	ative	Major Bleedin	g	Study Limitations	Risk of NCS in
Tear		(n)			(70)			NC3 (u)				Periou (70)					Stented Pt
			Low	Intermediate	High	Cardiac	Unknown		Endpoints	(%)	ASA	P2Y ₁₂ Inhibitor	DAPT	Endpoints	(%)		
Risk of NO	CS following	PCI Wit	h BMS														
Kaluza, 2000 (103) <u>10758971</u>	Retrospective	40	N/A	33	65	2	N/A	13	Death, MI	20, 17.5	5	12.5	2.5	Tx or reoperation	27	SC, small sample size, retrospective, APT status not well described	All MACE <2 wk after PCI, emphasizing high- risk early period
Wilson, 2003 (104) 1 <u>2875757</u>	Retrospective	207	N/A	36	58	N/A	6	1–60	Death, MI, ST or revascularization	4	51	14	26	"Excessive" surgical site bleed, Tx	2, 33	Retrospective, SC	All events occurred within first 6 wk
Sharma AK, et al., 2004 (105) <u>15390248</u>	Retrospective	47	N/A	68	30	N/A	2	<21 (n=27); 21–90 (n=20)	Death or MI	25 (<21 d), 15 (21–90 d)	N/A	74 (<21 d), 70 (21–90 d)	N/A	Tx, reoperation	29 (<21 d), 0 (21– 90 d)	Small sample size, retrospective, APT status not well described, SC, 6/7 deaths in first 21 d considered probable ST	Study confined to early phase NCS pt. 6/7 IE in pts who discontinued DAPT. This study suggests importance of continuation of DAPT during early period.
Reddy, 2005	Retrospective	56	10	60	20	N/A	10	<42	MI or CVD	14	79*	32*	N/A	Reoperation, Tx >2 PRBC, Hb drop >2 g/dL	5	Small sample size, retrospective, APT status not well described, SC.	All IE occurred within 42 d of PCI, emphasizing

(106) 15757604														or IC, IO or RP	bleed		All 3 bleeding episodes were in pts receiving P2Y12 inhibitor.	high risk early period
Brichon, 2006 (107) <u>16996274</u>	Retrospective	32	N/A	100	N/A	N/A	N/A	<90	ST	9	66	0	0	Hemothorax or	RP bleed	10	Small sample size, retrospective. 30% of pts received only heparin	ST rather higher (9%) within 3 mo of stenting and lung surgery
Nuttal, 2008 (108) <u>18813036</u>	Retrospective	889	21	46	33	N/A	N/A	64	Death, MI, ST, or TLR	Overall 5.2; <30 d 10.5; 30-90 d 3.8; 90-365 d 2.8		64.5†		Need for non-F	RBC tx	5	Retrospective, APT status not well described, SC	This study emphasizes that risk is highest very early after PCI
Risk of N	CS Following	PCI W	ith DES	1-	1.	1				-		T	1.	I	1-			
Compton, 2006 (109) 17056330	Retrospective	38	31	35	15	N/A	19	260	MI	0	83	40	*†	Postop Tx	3		Small sample size, retrospective, APT status not well described, SC	MACE is low with NCS performed late after PCI
Brotman, 2007 (110) 18081175	Retrospective	114	52	42	6	N/A	N/A	236	MI, ST, or death	1.8	1.8	0	21	Reoperation, IC or RP bleed	0.9		Retrospective, SC	MACE is low with NCS performed late after PCI
Conroy, 2007 (111) <u>18084986</u>	Retrospective	24 (42)	N/A	N/A	N/A	N/A	N/A	N/A	Ischemia on ECG, troponin elevation, or ST	7	N/A	50	N/A	Surgical site bleed or reoperation	2.4		Small sample size, retrospective, APT status not well described, SC. MACE and bleeding EP not well defined	IE: 3/14 pts who discontinued DAPT to ASA alone had ST. 4/4 with alternate anticoagulant or IV APT had no ST, suggesting value of DAPT to prevent IE.
Rhee, 2008 (112) 18475013	Retrospective	141	N/A	96	N/A	N/A	N/A	228	ST	5	5	0	0	N/A	N/A		Retrospective, SC, bleeding endpoint not well defined	IE: >7 d of P2Y ₁₂ inhibitor discontinuation and use of Taxus stent was associated with ST
Godet, 2008 (113) <u>18310674</u>	Retrospective	96	N/A	26	74	N/A	N/A	425	Troponin elevation, ST	12, 2	70	38	N/A	N/A	N/A		Small sample size, APT status and bleeding endpoints not well described, SC	The risk of a serious complication, i.e., ST, was relatively low (2%)
Rabbitts, 2008 (114) <u>18813037</u>	Retrospective	520 (400 <1 y, 120 >1 y)	18	56	25	N/A	N/A	204	Death, MI, ST or revascularization	5.4 (6 <1 y, 3.3 >1 y)	70	33	*†	Surgical site, excessive bleed'	1		Retrospective, SC, APT not well described	IE: Trend to lower IE rate if NCS >1 y after PCI
Chia, 2010 (115) <u>20609638</u>	Retrospective	710	N/A	N/A	N/A	N/A	N/A	348	MI or ST	1.5	14	9	18	N/A	N/A		Retrospective, bleeding endpoint not well defined, questionnaire-based	IE: The low IE rate may have been due to late NCS plus questionnaire method, i.e.,

																	underreporting
Anwarud din, 2009 (116) <u>19539259</u>	Retrospective	481 (606)	5.6	55.6	20	22	N/A	390	Primary ST (definite and moderate probability); secondary death, nonfatal MI, ST	2; 9	15	1	21	N/A	N/A	Retrospective, bleeding endpoint not well defined, SC	Risk of MACE higher if NCS <30 d after PCI but some level persisted for 2-3 y after PCI
Assali, 2009 (117) <u>19626693</u>	Retrospective	78	N/A	81	19	N/A	N/A	414	MI, ST, or death	7.7	18	42	21	Hb drop >2 g/dL	16.7	Small sample size, retrospective, SC	Most MACE occurred <1 wk after NCS and there was no difference in MACE between 6–12 mo vs. >12 mo
Berger, 2010 (118) 20850090	Prospective registry, retrospective	206	N/A	76	20	N/A	4	179	Death, MI, or ST	1.9	N/A	N/A	N/A	N/A	N/A	APT status and bleeding endpoint not well described	Most IEs occur within 1 st wk after NCS
Gandhi, 2011 (119) <u>20824750</u>	Retrospective	135 (191)	23	62	15	N/A	N/A	547	Death, ST, or MI	0.5; 2	54	30	N/A	Bleeding with hypotension, blood loss >500cc, or >2 Tx	6	Retrospective, SC, APT status not well defined	Low risk of IE when NCS performed relatively late after PCI
Brilaki, 2011 (120) 21315220	Retrospective	164	100	N/A	N/A	N/A	N/A	<365	Death, MI or ST	0.6	N/A	N/A	N/A	N/A	N/A	Retrospective, APT status and bleeding endpoint not well defined	Low risk of events in low risk NCS

*All studies were retrospective analyses.

†Rates of individual or dual APT not provided.

APT indicates antiplatelet therapy; ASA, aspirin; BMS, bare-metal stent; CVD, cardiovascular disease; DAPT, dual antiplatelet therapy; ECG, echocardiogram; Hb, hemoglobin; IC, intracranial; IE, ischemic events; IO, intraocular; IV, intravenous; MACE, major adverse coronary event; MI, myocardial infarction; N/A, not applicable; NCS, noncardiac surgery; PCI, percutaneous coronary intervention; postop, postoperative; PRBC, packed red blood cell; pt, patient; RP, retroperitoneal; rx, therapy; SC, single center; and ST, stent thrombosis; and Tx, transfusion.

Table 2. Risk of Noncardiac Surgery Following BMS or DES

Author, Year	Study Type	Study S	Size (n)		Type of Su	ہ) irgery	6)	PCI to NCS (d)		MACE		APT	in Periop Perioc	d (%)	Major blee	ding	Study Limitations	Risk of NCS in Stented Pt

Small study defined as <100 patients *Percentage of patients taking both ASA and P2Y₁₂ inhibitor not provided. †Rates of individual or dual APT not provided. ‡Total number of patients in Wijeysundera study was 8116; 2725 patients underwent stenting <2 y. §Total procedures=7,998; 2,725 <2 y after stent implantation.

ASA indicates aspirin; APT, anti-platelet therapy; BMS, bare-metal stent; DAPT, dual anti-platelet therapy; DES, drug-eluting stent; GUSTO, Global Utilization of Streptokinase and Tissue Plasminogen Activator for Occluded Coronary Arteries; IE, ischemic events; MACE, major adverse cardiac events; MI, myocardial infarction; n, subgroup; N/A, not available; NCS, noncardiac surgery; PCI, percutaneous coronary intervention; periop, perioperative; postop, postoperative; pt, patient; SC, single center; ST, stent thrombosis; TLR, target lesion revascularization; TVR, target vessel revascularization; and Tx, transfusion.

Data Supplement 19. Perioperative Beta-Blocker Therapy (Section 6.2.1)

Please see the complete Evidence Review Committee's Systematic Review Report for more information (128). The following few tables/figures are provided for ease of use and may contain data from Poldermans studies which were included in the scope of the systematic review.

Table 1. Summary of Included Studies

Study (Year)	N	Inclusion Criteria	Exclusion Criteria	Types of Surgery	Long-Term Preoperative Beta-Blocker Therapy	Participant Characteristics
Randomized C	ontrolled	Trials			•	
Mangano et al. (1996) (129) <u>8929262</u>	200	Known CAD or ≥2 risk factors (≥65 y of age, hypertension, current smoker, elevated cholesterol level, diabetes mellitus)	Pacemaker dependency, resting ECG abnormalities (left bundle-branch block, marked ST-T abnormalities)	Elective vascular (41%), intra-abdominal (21%), orthopedic (14%), neurosurgical (9%), or other (16%) procedures	13%	Mean age 67.5 y, 39% with known CAD
Jakobsen et al. (1997) (130) <u>9327317</u>	100	Pts undergoing thoracotomy for lung resection with no known current or previous cardiovascular disease	NR	Intrathoracic (100%) procedures	NR	66% males, mean age 60.4 y
Bayliff et al. (1999) (131) <u>10086546</u>	99	Pts >18 y of age undergoing major thoracic operation	Prior beta-blocker use, asthma, HF, heart block, supraventricular tachyarrhythmias, prior specific drug use (digoxin, quinidine, procainamide, amiodarone, diltiazem, verapamil)	Intrathoracic (100%) procedures	0%	62% males, mean age 62.5 y, 6% with prior MI, 5% with current angina
DECREASE-I (1999) (132) <u>10588963</u>	112	Pts with ≥1 cardiac risk factor (>70 y of age, angina; prior MI, HF, diabetes mellitus, limited exercise capacity, ventricular arrhythmias) and positive result on dobutamine stress echocardiography.	Prior beta-blocker use, asthma, very high- risk dobutamine stress echocardiography result (extensive wall-motion abnormalities, strong evidence of left main or severe 3-vessel CAD)	Major vascular (100%) procedures	0%	87% males, mean age 67.5 y, 100% with known CAD, 52% with prior MI, 32% with current angina
Raby et al. (1999) (133) <u>10071990</u>	26	Pts with preoperative myocardial ischemia detected by 24-h ECG monitoring performed within 1–12 d before surgery	Baseline ST-T abnormalities on ECG that preclude accurate interpretation of ECG monitoring for ischemia	Major vascular (100%) procedures	35%	46% males, mean age 68.1 y, 38% with prior MI or current angina
Zaugg et al. (1999)* (134) <u>10598610</u>	43	Pts ≥65 y of age	Prior beta-blocker use, other prior drugs (beta-adrenergic agonists, glucocorticoids, anticonvulsants), heart block, rhythm other than sinus on ECG, HF, bronchospasm, systemic infection, neurological disorders	Intra-abdominal (81%), orthopedic (7%), and other (12%) procedures	0%	40% males, mean age 74.6 y, 37% with known CAD
Urban et al.	107	Pts 50 to 80 y of age undergoing elective	Specific ECG abnormalities (heart block,	Orthopedic (100%) procedures	28%	Mean age 69.5 y, 17% with prior MI, 31% with

(2000) (135) <u>10825304</u>		total knee arthroplasty with known CAD or ≥1 risk factor (≥65 y of age, hypertension, current smoker, elevated cholesterol level, diabetes mellitus)	bundle-branch block, atrial arrhythmias, LV hypertrophy with repolarization abnormalities), LVEF <30%, symptomatic mitral or aortic valvular disease, bronchospasm			current angina
POBBLE (2005) (136) <u>15874923</u>	103	Pts undergoing major elective infrarenal vascular surgery under general anesthesia	Prior MI in past 2 y, unstable angina, positive dobutamine stress test, prior beta- blocker use, asthma, aortic stenosis, heart rate ≤45 beats/min, systolic BP <100 mm Hg	Major vascular procedures (100%)	0%	78% males, median age 73 y
DIPOM (2006) (137) <u>16793810</u>	921	Pts with diabetes mellitus >39 y of age undergoing noncardiac surgery with expected duration >1 h	Long-term beta-blocker use, conditions indicating beta blocker treatment, severe HF, heart block	Orthopedic (33%), intra-abdominal (28%), neurosurgical (8%), vascular (7%), gynecological (5%), and other (19%) procedures	0%	59% males, mean age 64.9 y, 8% with prior MI, 11% with current angina
Lai et al. (2006) (138) 16687084	60	Pts ≥65 y of age undergoing esophagectomy for esophageal cancer with no known prior CAD	Prior beta-blocker use, heart rate ≤55 beats/min, systolic BP ≤100 mm Hg, heart block	Intrathoracic (100%) procedures	0%	82% males, median ages 66 (beta blocker arm) and 67 (control arm),
MaVS (2006) (139) <u>17070177</u>	496	Pts (ASA-PS Class ≤3) undergoing major vascular (abdominal aortic repair, infra- inguinal, or axillo-femoral bypass) surgery	Long-term beta-blocker use, current amiodarone use, reactive airways disease, HF, heart block	Major vascular (100%) procedures	0%	76% males, mean age 66.1 y, 14% with prior MI, 9% with current angina
Neary et al. (2006) (140) <u>16764198</u>	38	Pts undergoing emergency surgery with ≥1 of the following criteria: CAD, cerebrovascular disease (prior stroke or TIA), ≥2 minor risk criteria (≥65 y of age, hypertension, smoker, diabetes mellitus, hypercholesterolemia)	Prior beta-blocker use, heart rate <55 beats/min, heart block, chronic obstructive airway disease, asthma, cardiovascular collapse, uncorrected hypovolemia	Intra-abdominal (29%), amputation (24%), major vascular (21%), orthopedic (16%), and other (10%) procedures	0%	NR
BBSA (2007) (141) <u>17585213</u>	219	Pts undergoing surgery with spinal anesthesia with known CAD or ≥2 risk factors (≥65 y of age, hypertension, current smoker, elevated cholesterol level, diabetes mellitus)	Prior beta-blocker use, significant HF, heart block, severe asthma, left bundle- branch block	Orthopedic (67%), urologic (25%), and other (8%) procedures	0%	55% males, mean age 70.0 y, 8% with prior MI, 6% with current angina
POISE-1 (2008) (142) <u>18479744</u>	8,351	Pts ≥45 y of age and ≥1 of the following criteria: CAD, PVD, stroke, hospitalization for HF within past 3 y, major vascular surgery, or ≥3 minor risk factors (HF, TIA, diabetes mellitus, renal insufficiency, age >70 y, nonelective surgery, intrathoracic surgery, or intraperitoneal surgery)	Prior beta-blocker use, verapamil use, heart rate <50 beats/min, heart block, asthma, CABG surgery in previous 5 y with no subsequent ischemia, low-risk surgery	Vascular (41%), intraperitoneal (22%), orthopedic (21%), and other (16%) procedures	0%	63% males, mean age 69.0 y, 43% with known CAD
Yang et al. (2008) (143) <u>18953854</u>	102	Pts ≥45 y of age with ≥1 of the following criteria: CAD, PVD, stroke, hospitalization for HF in prior 3 y, or ≥3 minor risk factors (HF, diabetes mellitus, ≥65 y of age, hypertension, hypercholesterolemia,	Prior beta-blocker use, heart rate <50 beats/min, cardiac pacemaker, heart block, asthma, chronic obstructive pulmonary disease	Intra-abdominal and intrathoracic procedures	0%	59% males, mean age 71.0 y

		smoker, intrathoracic surgery, or intraperitoneal surgery)					
DECREASE-	1,066	Pts ≥40 y of age undergoing elective	Current use, or contraindication to use, of	General surgical (39%), urolo	gic (19%),	0%	60% males, mean age 65.4 y, 6% with current
IV (2009)		noncardiovascular surgery with an estimated	beta blockers or statins	orthopedic (16%), ear-nose-t	nroat (12%), and		angina, 5% with previous MI
(144)		1%–6% perioperative cardiovascular risk		other surgical (14%) procedu	res

Figure 1. Effect of Perioperative Beta Blockade on In-Hospital or 30-Day Nonfatal MI in RCTs, With Members of the DECREASE Family of Trials Excluded

Effect of perioperative beta blockade on in-hospital or 30-day nonfatal MI, within subgroups defined by the POISE-1 trial versus other trials. The pooled effect is expressed as a pooled RR with associated 95% CI. The solid black diamonds represent point estimates in individual RCTs. The area of each gray square correlates with its contribution toward the pooled summary estimates. Horizontal lines denote 95% CIs. Estimates to the left of the line of unity (i.e., RR: 1) indicate superior clinical outcomes (i.e., fewer nonfatal MIs) with beta blockade (*"Favors Beta-Blockers"*), whereas estimates to the right of the line of unity indicate superior clinical outcomes with control (*"Favors Control"*). The blue diamonds represent the pooled estimates for all studies (RR: 0.72; 95% CI: 0.59–0.86), as well as the POISE-1 trial (RR: 0.70; 95% CI: 0.57–0.86) and the subgroup of other trials (RR: 0.76; 95% CI: 0.47–1.21). Statistical heterogeneity, as measured by the I² statistic, was 0% for the overall analysis.

BBSA indicates Beta Blocker in Spinal Anesthesia; CI, confidence interval; DECREASE, Dutch Echocardiographic Cardiac Risk Evaluation Applying Stress Echocardiography; DIPOM, Diabetic Postoperative Mortality and Morbidity; MaVS, Metoprolol After Vascular Surgery; MI, myocardial infarction; POBBLE, Perioperative Beta Blockade; POISE, Perioperative Ischemic Evaluation Study; RCT, randomized controlled trial; and RR, relative risk.

Figure 2. Effect of Perioperative Beta Blockade on In-Hospital or 30-Day Nonfatal Stroke in RCTs, With Members of the DECREASE Family of Trials Excluded

Effect of perioperative beta blockade on in-hospital or 30-day nonfatal stroke, within subgroups defined by the POISE-1 trial versus other trials. The pooled effect is expressed as a pooled RR with associated 95% CI. The solid black diamonds represent point estimates in individual RCTs. The area of each gray square correlates with its contribution toward the pooled summary estimates. Horizontal lines denote 95% CIs. Estimates to the left of the line of unity (i.e., RR: 1) indicate superior clinical outcomes (i.e., fewer nonfatal strokes) with beta blockade (*"Favors Beta-Blockers"*), whereas estimates to the right of the line of unity indicate superior clinical outcomes with control (*"Favors Control"*). The blue diamonds represent the pooled estimates for all studies (RR: 1.86; 95% CI: 1.09–3.16), as well as the POISE-1 trial (RR: 1.93; 95% CI: 1.01–3.68) and the subgroup of other trials (RR: 1.72; 95% CI: 0.67–4.40). Statistical heterogeneity, as measured by the I² statistic, was 0% for the overall analysis.

BBSA indicates Beta Blocker in Spinal Anesthesia; CI, confidence interval; DECREASE, Dutch Echocardiographic Cardiac Risk Evaluation Applying Stress Echocardiography; DIPOM, Diabetic Postoperative Mortality and Morbidity; MaVS, Metoprolol After Vascular Surgery; POBBLE, Perioperative Beta Blockade; POISE, Perioperative Ischemic Evaluation Study; RCT, randomized controlled trial; and RR, relative risk.

Figure 3. Effect of Perioperative Beta Blockade on In-Hospital or 30-Day Mortality in RCTs, With Members of the DECREASE Family of Trials Excluded

Effect of perioperative beta blockade on in-hospital or 30-day mortality rate, within subgroups defined by POISE-1 trial versus other trials. The pooled effect is expressed as a pooled RR with associated 95% CI. The solid black diamonds represent point estimates in individual RCTs. The area of each gray square correlates with its contribution toward the pooled summary estimates. Horizontal lines denote 95% CIs. Estimates to the left of the line of unity (i.e., RR: 1) indicate superior clinical outcomes (i.e., fewer deaths) with beta blockade (*"Favors Beta-Blockers"*), whereas estimates to the right of the line of unity indicate superior clinical outcomes with control (*"Favors Control"*). The blue diamonds represent the pooled estimates for all studies (RR: 1.30; 95% CI: 1.03–1.63), as well as the POISE-1 trial (RR: 1.33; 95% CI: 1.03–1.73) and the subgroup of other trials (RR: 1.17; 95% CI: 0.70–1.94). Statistical heterogeneity, as measured by the I² statistic, was 0% for the overall analysis.

BBSA indicates Beta Blocker in Spinal Anesthesia; CI, confidence interval; DECREASE, Dutch Echocardiographic Cardiac Risk Evaluation Applying Stress Echocardiography; DIPOM, Diabetic Postoperative Mortality and Morbidity; MaVS, Metoprolol After Vascular Surgery; POBBLE, Perioperative Beta Blockade; POISE, Perioperative Ischemic Evaluation Study; RCT, randomized controlled trial; and RR, relative risk.

					Inclusion Criteria	Exclusion Criteria			Primary Endpoint (Efficacy) and Results	Safety Endpoint and Results	Secondary Endpoint and Results		
Oliver MF, et al., 1999 (150) <u>10519497</u>	To evaluate the impact of the alpha-2 adrenergic agonist, mivazerol, on rates of MI or cardiac death in pts with known CHD undergoing noncardiac surgery	A double- blind randomized placebo- controlled trial was conducted in 61 European centers	Mivazerol, 4.0 mcg/kg, was given during the first 10 min followed by a constant rate infusion. Infusion was started 20 min before the induction of anesthesia and continued for 72 h postoperatively	0.9% saline solution started 20 min before the induction of anesthesia	Pts with known CHD and those at high risk for CHD were eligible for the trial. All were scheduled to have noncardiac surgery estimated to last for at least 1 h and to have postsurgical hospitalization of at least 4 d.	UA, MI in the past 14 d, uninterpretable ECG Q-waves, cardiogenic shock, prescribed alpha agonist, severe hepatic disorders, emergency surgery, pregnant or nursing women or women aged <45 y without adequate contraception	N/A	N/A	Results presented relate to the 1,897 pts with known previous CHD. Preplanned subgroup analysis based on tests of heterogeneity. Primary endpoint was the incidence of acute MI or death during the intra- and postop hospitalization period (up to 30 d after surgery). 10.4% decrease in the primary endpoint (MI or death) and a 37% reduction in all-cause death. Secondary endpoints relate to the period of 30 d (follow- up visit) included HF, life-threatening arrhythmias, and UA	Hypotension was defined as a decrease in systolic BP of ≥20% below the baseline figure. In 10.5% (150) of mivazerol group pts and 9.4% (134) of placebo group pts, the infusion had to be stopped prematurely: of these, 62% were because of adverse events, such as hypotension, brady- or tachycardia, cardiac arrest, or organ failure; 19% (of the 62%) had to be withdrawn from the trial	NS	Cardiac deaths: MI endpoint 95% CI: 0.25–0.96 (p=0.037); for all surgeries 95% CI: 0.67–1.18 (p=NS); for vascular surgery 95% CI: 0.45–0.98 (p=0.03)	Overall study negative, positive results presented from CHD pts (not those pts with only risk factors)
Stuhmeier KD, et al., 1996 (151) <u>8873539</u>	To evaluate the effects clonidine (n=145) or placebo (n=152) on the incidence of periop myocardial ischemic episodes, MI,	Randomized double-blind study design	2 mcg/kg-1 oral clonidine (145 pts)	Oral placebo (15 pts)	Pts undergoing nonemergent vascular surgery who were not taking clonidine	Chronic myocardial ischemia, preop digitalis or chronic clonidine medication, AF, left or right BBB, and second-degree or greater atrioventricular- nodal block in the preop ECG	N/A	N/A	Myocardial IEs reduced, no change in MI and cardiac death	More fluid given to clonidine group to treat hypotension	N/A	Reduced the incidence of periop myocardial IEs from 39% (59 of 152) to 24% (35 of 145) (p<0.01)	Size

Data Supplement 21. Alpha-2 Agonists (Section 6.2.3)

	and cardiac death												
Wallace AW, et al., 2004 (152) <u>15277909</u>	To test the hypothesis that prophylactic clonidine reduces the incidence of periop myocardial ischemia and postop death in pts undergoing noncardiac surgery	Prospective, double- blinded, clinical trial	125 pts with CAD or risk factors	65 pts with CAD or risk factors	Definite CAD, peripheral arterial disease, and previous vascular surgery or 2 cardiac risk factors	UA, uninterpretable ECG, preop alpha blocker use, symptomatic AS; systolic BP <100 mmHg; and refusal or inability to give informed consent	0.2 mg oral tablet of clonidine 1 h before surgery and a 7.0 cm ² transdermal patch of clonidine	Placebo pill and patch	30-d mortality reduced, 2-y mortality reduced, decreased IEs	N/A	N/A	p=0.035 for 30-d mortality, p=0.048 for 2-y mortality, p=0.01 for IEs	Size

AF indicates atrial fibrillation; AS, aortic stenosis; BBB, bundle branch block; BP, blood pressure; CAD, coronary artery disease; CHD indicates coronary heart disease; ECG, electrocardiogram; IE, ischemic episode; MI, myocardial infarction; N/A, not available; NS, nonsignificant; periop, perioperative; postop, postoperative; preop, preoperative; and UA, unstable angina.

Data Supplement 22. Perioperative Calcium Channel Blockers (Section 6.2.4)

Study Name, Author, Year	Aim of Study	Study Type	Study Intervention	Study Comparator Group	Patient Pop	ulation	I	Endpoints	P Values, OR: HR: RR: & 95% Cl:	Study Limitations & Adverse Events	
					Inclusion Criteria	Exclusion Criteria	Primary Endpoint (efficacy and results)	Safety Endpoint and Results	Secondary Endpoint and Results		
Wijeysundera DN, et al., 2003 (153) <u>12933374</u>	To evaluate the impact of CCBs on death, MI, supraventricular tachycardia, and major morbid events	Meta- analysis RCT evaluating CCBs during noncardiac surgery	CCB, 11 studies with 1,107 pts	Placebo	Published RCTs that evaluated CCBs (administered immediately preoperatively, intraoperatively, or postoperatively within 48 h) during noncardiac surgery, and reported any of the following outcomes: death, MI, ischemia, or supraventricular tachycardia	Studies exclusively recruited prior organ transplant recipients, individuals younger than 18 y of age, pts who had already developed supraventricular tachycardia, or pts undergoing surgery for subarachnoid hemorrhage	Mortality not decreased, ischemia and supraventricular tachycardia reduced	Trend toward hypotension	Combined endpoint of MI and death	RR: 0.49 (95% CI: 0.3– 0.8) for ischemia; RR: 0.52 (95% CI: 0.37– 0.72) for supraventricular tachycardia; RR: 0.35 (95% CI 0.15–0.86)	Meta- analysis, different types of CCBs
Kashimoto S, et al., 2007 (154) <u>17321926</u>	To assess whether nicorandil reduces the likelihood of cardiac events during and after intermediate risk surgery	Multicenter randomized trial	Nicoradil intraoperatively during surgery	Standard therapy, 237 pts	Intermediate cardiac risk pts having intermediate cardiac risk surgery	N/A	N/A	p=0.02; 95% Cl: 0.03– 0.76	N/A	95% CI: 0.03–0.76	Size, limited report

Study Name, Author, Year	Aim of Study	Study Type	Study Intervention	Study Comparator Group	Patient P	opulation		Endpoint	S	P Values, OR: HR: RR: & 95% Cl:	Study Limitations & Adverse Events
					Inclusion Criteria	Exclusion Criteria	Primary Endpoint (Efficacy) and Results	Safety Endpoint and Results	Secondary Endpoint and Results		
Turan A, et al., 2012 (155) <u>22253266</u>	To evaluate the association of ACEI therapy with periop respiratory morbidity in adult noncardiac surgical pts, 30-d mortality secondary endpoint	Retrospective, controlled	ACEI	No ACEI	79,228 adult general surgical pts treated at the Cleveland Clinic main campus hospital between 2005 and 2009. Pts who received only general anesthesia were included.	30-d follow up data unavailable	The observed incidence of experiencing ≥1 intraoperative respiratory morbidity was 3.6% (n=360) for pts who took ACEI and 2.7% (n=1814) for pts who did not. The observed incidence of the collapsed postop respiratory morbidity was 4.2% (n=412) and 3.1% (n=2053) in pts who did and did not take ACEIs.	N/A	No significant association was found between ACEI use and any of the secondary outcomes, including 30-d mortality and the composite of in-hospital morbidity and mortality	Secondary endpoint: 30-d mortality (OR: 0.93; 95% CI: 0.73– 1.19), ACEI vs. non– ACEI p=0.56; composite of in- hospital morbidity and mortality (OR: 1.06; 95% CI: 0.97– 1.15)	Retrospective chart review to obtain data

Data Supplement 23. Angiotensin-Converting Enzyme Inhibitors (Section 6.2.5)

ACEI indicates angiotensin-converting enzyme inhibitors; N/A, not available; periop, perioperative; and pt, patient.

Data Supplement 24. Antiplatelet Agents (Section 6.2.6)
